Industry: Russells Technical Products

International: Leibniz Institute for Tropospheric Research)

Pi Convection–Cloud Chamber

Most cloud chamber facilities are focused on research related to activation/nucleation and condensation growth in a uniform “parcel-like” environment

Most cloud chamber facilities are focused on research related to activation/nucleation and condensation growth in a uniform “parcel-like” environment

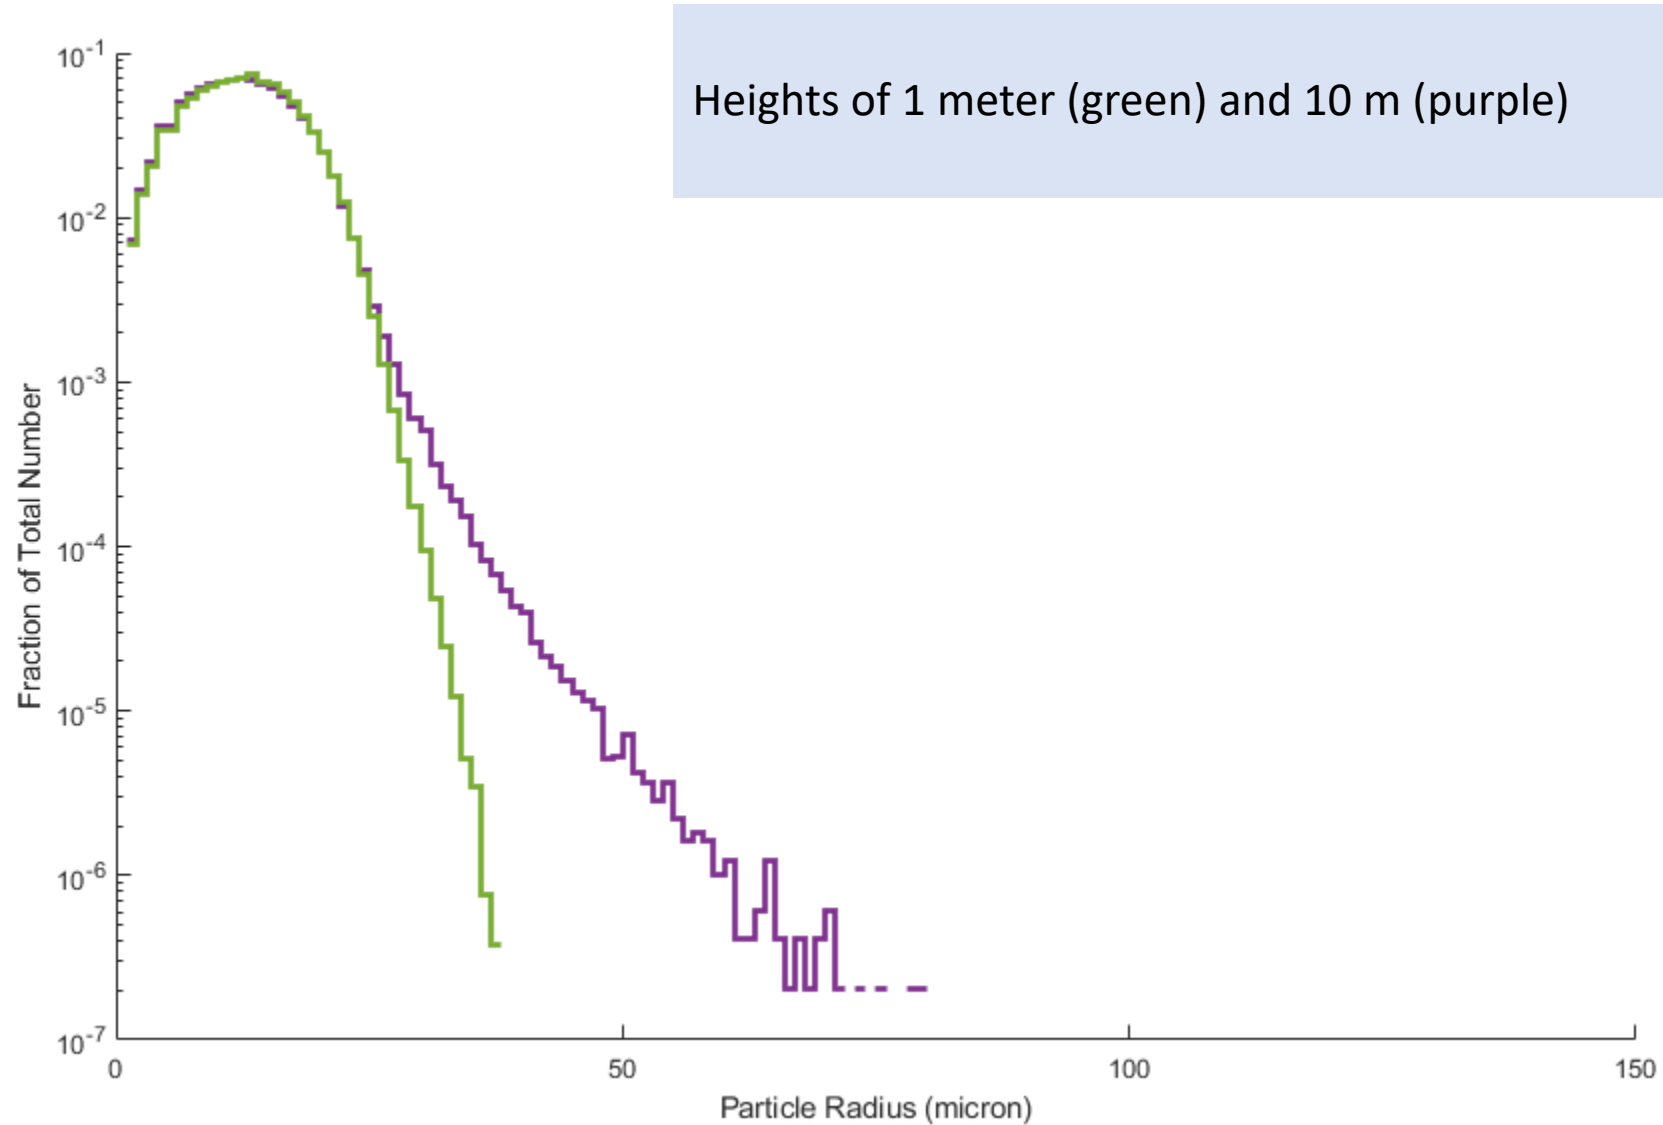

The convection—cloud chamber allows aerosol-cloud interactions such as aerosol processing to be explored.

Most cloud chamber facilities are focused on research related to activation/nucleation and condensation growth in a uniform “parcel-like” environment

The convection—cloud chamber allows aerosol-cloud interactions such as aerosol processing to be explored.

The ACDC2 facility currently under design expands to the capability of studying growth by collision—coalescence and related mixed-phase cloud processes.

Same droplet size distribution, changing height

Work in collaboration with J. Kuntzleman (MTU) and S. Krueger (Univ. Utah)

Funding for Pi Chamber and ACDC2 provided by:
